An algorithm for automorphisms of infinite dimensional Grassmann algebras

NAZAN AKDOĞAN

ABSTRACT. Let G be the infinite dimensional Grassmann algebra. In this study, we determine a subgroup of the automorphism group $\mathrm{Aut}(G)$ of the algebra G which is of an importance in the description of the group $\mathrm{Aut}(G)$. We give an infinite generating set for this subgroup and suggest an algorithm which shows how to express each automorphism as compositions of generating elements.

1. INTRODUCTION

Let K be a field of characteristic zero and let A_m be the free unitary associative algebra of rank m generated by $f_1, \ldots, f_m$. Then the m-generated Grassmann algebra G_m is defined as the factor algebra A_m/I_m such that I_m is the ideal of G_m generated by all elements of the form $f_i f_j + f_j f_i$, $1 \leq i, j \leq m$. We see that G_m is generated by $e_i = f_i + I_m$, $i = 1, \ldots, m$. Clearly the Grassmann algebra G_m is of the canonical basis elements of the form

$$e_{i_1} \cdots e_{i_k},\ i_1 \leq \cdots \leq i_k,\ k = 1, \ldots, m$$

and 1. Note that $e_i e_j = -e_j e_i$ for all $i, j = 1, \ldots, m$, since $e_i^2 = 0$ as a consequence of characteristic of K. The algebra G_m satisfies the identity

$$[[x, y], z] = (xy - yx)z - z(xy - yx) = 0 \tag{1.1}$$

for all $x, y, z \in G_m$. In particular one has $\mathrm{ad}^2(x) = 0$ for $x \in G_m$.

The Grassmann algebra has become an important tool in many fields of mathematics as well as physics. One may see the book by Bourbaki [5] for a background. Working on the automorphism group of a given algebra has always become a remarkable approach in order to recognize and characterize the algebra. One of the works about the group of automorphisms of the Grassmann algebra is done by Berezin. Let U_m be the group of linear automorphisms and let B_m be the group of automorphisms of the form $T(e_p) = e_p + f_p(e_1, \cdots, e_m)$, where f_p does not have a linear component. Berezin [4] determined the group of automorphisms of G_m as the semidirect product of the subgroups B_m and U_m when K is the field of complex numbers. Djoković [6] showed that when $\mathrm{char} K \neq 2$, the group of automorphisms of G_m can be written as the semidirect product of the group of inner automorphisms of G_m and the subgroup of $\mathrm{Aut}(G_m)$ which preserves the $\mathbb{Z}_2$-grading of G_m. The description of the automorphism group $\mathrm{Aut}(G_m)$ of the Grassmann algebra G_m can be explicitly found in the literature (see e.g. Laszlo [9]).

Theorem 1.1. *The group* $\mathrm{Aut}(G_m)$ *of* K*-automorphisms of* G_m *is isomorphic to a semidirect product of those three subgroups.*

$$\mathrm{Aut}(G_m) = \mathrm{Inn}(G_m) \rtimes \mathrm{A}_v \rtimes \mathrm{Gl}_m(K)$$

where

i) $\mathrm{Gl}_m(K)$ *is the group of automorphisms sending* e_i *to a linear combination of* $e_1, \dots, e_m$ *such that the determinant of the coefficients is nonzero,*

ii) $\mathrm{Inn}(G_m)$ *is the group of inner automorphisms of* G_m*. Each automorphism in this class is of the form* $1 + \mathrm{ad}x$*, where* $\mathrm{ad}x(e_i) = [x, e_i] = xe_i - e_i x$*,*

iii) A_v *is the group of automorphisms sending* e_i *to* $e_i + v_i$ *such that* v_i *is a linear combination of monomials of odd length* ≥ 3*.*

Bavula [1] showed that the group of automorphisms of G_m can be written similarly when K is a commutative ring. In this study, following the results on the automorphism group of G_m and extending the idea of the finite dimensional Grassmann algebra to the infinite generated (or equivalently infinite dimensional) Grassmann algebra G over the field K of characteristic zero, we give a class of automorphisms of G, which consists of a subgroup H of the group $\mathrm{Aut}(G)$ of automorphisms of the Grassmann algebra G.

The group H corresponds to a subgroup of A_v in the third class of Theorem 1.1 in the setting of infinite generation, which can be considered as an important approach in the description of the group $\mathrm{Aut}(G)$ of K-automorphisms of the Grassmann algebra G. In this study, we suggest an algorithm which expresses each automorphism in H in terms of automorphisms defined in a certain set. This is also to show that this set provides an infinite list of generators for the group H.

2. Preliminaries

Let K be a field of characteristic zero. Let A stand for the free unital associative K-algebra generated by an infinite countable set $F = \{f_1, f_2, \dots\}$. We define the quotient algebra

$$G = A/I$$

where I is the ideal of A generated by all elements of the form

$$f_i f_j + f_j f_i, \ f_i, f_j \in F.$$

Then G is the infinite dimensional unitary Grassmann algebra generated by the set

$$E = \{e_j = f_j + I : j = 1, 2, \dots\}$$

over the field K. For each $e_i \in E$, we have $e_i^2 = 0$ and G has the following canonical basis.

$$B = \{e_{i_1} \cdots e_{i_k} : \ k \geq 1, \ i_1 < \cdots < i_k\} \cup \{1\}.$$

The algebra G satisfies the identity $[[x, y], z] = 0$ for all $x, y, z \in G$. Hence, the Grassmann algebra G is a PI-algebra. Krakowski and Regev [8] showed that the T-ideal of the infinite dimensional unitary Grassmann algebra over a field of characteristic zero is generated by $[[x, y], z]$. It is still valid in the case of positive characteristic by Giambruno and Koshlukov [7]. The T-ideal of the infinite dimensional unitary Grassmann algebra over a finite field is completely defined by Bekh-Ochir and Rankin [2]; moreover, they [2, 3] describe the T-space of this algebra over a field of arbitrary characteristic .

Let $G^{(0)}$ be the subvector space of G consisting of linear combinations of monomials of even length and let $G^{(1)}$ be the subvector space containing the linear combinations of monomials of odd length. Then obviously $G^{(0)}$ is the center of G, and as a vector space

$$G = G^{(0)} \oplus G^{(1)}.$$

This gives also a $\mathbb{Z}_2$-grading of the vector space G. It is straightforward to show that if

$$f : E \longrightarrow G$$

is a function such that $f(e_i)f(e_j)+f(e_j)f(e_i)=0$ for all $e_i, e_j \in E$, then f can be uniquely extended to a homomorphism of the infinite dimensional Grassmann algebra G.

Now consider the augmentation ideal $\omega(G)$ of G consisting of elements $p(e_1, e_2, \dots) \in G$ such that $p(0, 0, \dots) = 0$; i.e, if $x \in \omega(G)$ then

$$x = \sum c_j y_j, \;\; y_j \in B\backslash\{1\}, \;\; c_j \in K,$$

such that only a finite number of c_j's are nonzero. Let ϕ be an automorphism of G. Then we have following observation: $\phi(1) = 1$ and $\phi(e_i) \in \omega(G)$ for each $e_i \in E$. Since $[[x, y], z] = 0$ is an identity for G, we naturally obtain by identity (1.1) that $\mathrm{ad}^2 x = 0$, $x \in G$, and the map defined as

$$(\exp(\mathrm{ad}x))(y) = (1 + \mathrm{ad}x)(y) = \psi_x(y) = y + [x, y], \;\; y \in G$$

for a fixed $x \in G$, is an automorphism called *inner automorphism*. Note that $\psi_{x+y} = \psi_x\psi_y$, and the set

$$\mathrm{Inn}(G) = \{\psi_x : x \in G\}$$

is an abelian group called the inner automorphism group. Thus, the question on other automorphism classes arises naturally. Let x be an element in $G^{(1)} \cap \omega^3(G)$; i.e., the linear combination of the monomials of odd length at least 3, and let us define the map $f_x : E \longrightarrow G$ such that $f_x(e_i) = e_i + x$. Then

$$f_x(e_i)f_x(e_j) + f_x(e_j)f_x(e_i) = (e_ie_j + e_je_i) + (e_ix + xe_i) + (e_jx + xe_j) + 2x^2 = 0.$$

Hence f_x can be extended uniquely to a K-homomorphism $\phi_x : G \longrightarrow G$. In particular, the inverse of ϕ_x is ϕ_{-x}, when x is a monomial. In the sequel we give some technical lemmas which are to be utilized in the main results.

Lemma 2.1. *Let $x, y \in G^{(1)} \cap \omega^3(G)$. Then $\phi_x\phi_y = \phi_{x+\phi_x(y)}$.*

Proof. $\phi_x\phi_y(e_i) = \phi_x(e_i + y) = e_i + x + \phi_x(y) = \phi_{x+\phi_x(y)}(e_i)$. Note that $x + \phi_x(y) \in G^{(1)} \cap \omega^3(G)$. □

Now let us define some notations. Let $y = \beta e_{j_1} \cdots e_{j_{2n+1}}$ be a monomial in $G^{(1)} \cap \omega^3(G)$, $\beta \in K$. We define $y_{(i)} = (-1)^{i+1}\beta e_{j_1} \cdots e_{j_{i-1}} e_{j_{i+1}} \cdots e_{j_{2n+1}}$ for $i = 1, \dots, n$, and $\bar{y} = y_{(1)} + \cdots + y_{(2n+1)}$. As a consequence of this notation we have that $y\bar{y} = 0$ and $y_{(i)}\bar{y} = 0$ for $i = 1, \dots, n$. Additionally, by easy computations $\phi_x(\bar{y}) = \bar{y}$ for all $x \in G^{(1)} \cap \omega^3(G)$.

Lemma 2.2. *Let $x \in G^{(1)} \cap \omega^3(G)$ be an element and let $y \in G^{(1)} \cap \omega^3(G)$ be a monomial. Then*

$$\phi_x(y) = y + x\bar{y}.$$

Proof. Let $y = \beta e_{j_1} \cdots e_{j_{2n+1}}$. Using the fact that $x^n = 0$, $n \geq 2$, we have

$$\begin{aligned}
\phi_x(y) &= \beta(e_{j_1} + x)(e_{j_2} + x) \cdots (e_{j_{2n+1}} + x) \\
&= \beta e_{j_1} \cdots e_{j_{2n+1}} + x(\beta e_{j_2} e_{j_3} \cdots e_{j_{2n+1}} + \cdots + \beta e_{j_1} \cdots e_{j_{2n}}) \\
&= y + x(y_{(1)} + \cdots + y_{(2n+1)}) \\
&= y + x\bar{y}
\end{aligned}$$

□

The proof of following lemma is straightforward.

Lemma 2.3. *Let $x_1, \dots, x_k, x_{k+1} \in G^{(1)} \cap \omega^3(G)$ be monomials. If $\phi_{x_1+\cdots+x_k}$ is an automorphism, then*

$$\phi^{-1}_{x_1+\cdots+x_k}(x_{k+1}) = x_{k+1} - X\bar{x}_{k+1}$$

where

$$\begin{aligned} X =& x_1+\cdots+x_k - x_1(\bar{x}_2+\cdots+\bar{x}_k)-\cdots-x_k(\bar{x}_1+\cdots+\bar{x}_{k-1})\\ & x_1(\bar{x}_2\bar{x}_3+\cdots+\bar{x}_k\bar{x}_{k-1})+\cdots+x_k(\bar{x}_1\bar{x}_2+\cdots+\bar{x}_{k-1}\bar{x}_{k-2})\\ & \vdots\\ & +(-1)^{k-1}x_1(\bar{x}_2\bar{x}_3\cdots\bar{x}_k+\cdots+\bar{x}_k\bar{x}_{k-1}\cdots\bar{x}_2)+\cdots\\ & +(-1)^{k-1}x_k(\bar{x}_1\bar{x}_2\cdots\bar{x}_{k-1}+\cdots+\bar{x}_{k-1}\bar{x}_{k-2}\cdots\bar{x}_1). \end{aligned}$$

Let $\operatorname{supp}(x)$ be the set of generators appearing in the expression of a given monomial x. For instance $\operatorname{supp}(x)=\{e_{i_1},\ldots,e_{i_k}\}$ if $x=\alpha e_{i_1}\cdots e_{i_k}$ for some $\alpha\in K$.

Lemma 2.4. *Let $x,y\in G^{(1)}\cap\omega^3(G)$ be monomials such that $|\operatorname{supp}(x)\cap\operatorname{supp}(y)|\geq 2$. Then $\phi_x(y)=y$, and thus $x\bar{y}=0$.*

Proof. Let $y=\beta e_{j_1}\cdots e_{j_{2n+1}}$. Then

$$\begin{aligned}\phi_x(y)&=\beta(e_{j_1}+x)(e_{j_2}+x)\cdots(e_{j_{2n+1}}+x)\\ &=\beta e_{j_1}\cdots e_{j_{2n+1}}+\beta x(e_{j_2}\cdots e_{j_{2n+1}}-e_{j_1}e_{j_3}\cdots e_{j_{2n+1}}+\cdots+e_{j_1}\cdots e_{j_{2n}})\\ &=y\end{aligned}$$

Hence $x\bar{y}=0$ by Lemma 2.2. □

As a consequence of Lemma 2.4 we obtain the following corollary.

Corollary 2.1. *Let $x_1,\ldots,x_n,y\in G^{(1)}\cap\omega^3(G)$ be monomials such that $|\operatorname{supp}(x_i)\cap\operatorname{supp}(y)|\geq 2$ for each $i=1,\ldots,n$. Then $\phi_{x_1+\cdots+x_n}(y)=y$.*

Lemma 2.5. *Let $x_1,\ldots,x_n,y\in G^{(1)}\cap\omega^3(G)$ be monomials such that $|\operatorname{supp}(x_i)\cap\operatorname{supp}(y)|\geq 2$, for each $i=1,\ldots,n$. If $\phi_{x_1+\cdots+x_n}$ is an automorphism, then $\phi^{-1}_{x_1+\cdots+x_n}(y)=y$.*

Proof. Let $x=x_1+\cdots+x_n$. By Corollary 2.1 we have $\phi_x(y)=y$. Thus $\phi_x^{-1}(\phi_x(y))=\phi_x^{-1}(y)$. Finally, $\phi_x^{-1}(y)=y$. □

Lemma 2.6. *Let $x_1,\ldots,x_n\in G^{(1)}\cap\omega^3(G)$ be monomials where $n\geq 2$. Then*

$$\phi_{(-1)^{n-1}x_1\bar{x}_2\cdots\bar{x}_n}$$

is an automorphism. Furthermore,

$$\phi_{(-1)^{n-1}x_1\bar{x}_2\cdots\bar{x}_n}=\phi_{(-1)^{n-1}x_1(x_2)_{(1)}\bar{x}_3\cdots\bar{x}_n}\cdots\phi_{(-1)^{n-1}x_1(x_2)_{(2t+1)}\bar{x}_3\cdots\bar{x}_n}$$

where $\bar{x}_2=(x_2)_{(1)}+\cdots+(x_2)_{(2t+1)}$.

Proof. We make induction on n. Let us check the statement of the lemma for $n=2$. Let $x_2=v$. Then

$$\begin{aligned}\phi_{-x_1\bar{x}_2}&=\phi_{-x_1\bar{v}}\\ &=\phi_{-x_1(v_{(1)}+\cdots+v_{(2t+1)})}\\ &=\phi_{-x_1v_{(1)}-\cdots-x_1v_{(2t+1)}}\\ &=\phi_{-x_1v_{(1)}+\phi_{-x_1v_{(1)}}\phi^{-1}_{-x_1v_{(1)}}(-x_1v_{(2)}-\cdots-x_1v_{(2t+1)})}\\ &=\phi_{-x_1v_{(1)}}\phi_{\phi^{-1}_{-x_1v_{(1)}}(-x_1v_{(2)}-\cdots-x_1v_{(2t+1)})}\\ &=\phi_{-x_1v_{(1)}}\phi_{\phi_{x_1v_{(1)}}(-x_1v_{(2)}-\cdots-x_1v_{(2t+1)})}\\ &=\phi_{-x_1v_{(1)}}\phi_{-\phi_{x_1v_{(1)}}(x_1v_{(2)})-\cdots-\phi_{x_1v_{(1)}}(x_1v_{(2t+1)})}.\end{aligned}$$

Since $|\text{supp}(w_1v_{(1)})\cap\text{supp}(w_1v_i)| \geq 2$ for $i = 2, \ldots, 2t+1$, by Lemma 2.4 we have $\phi_{-x_1\bar{x}_2} = \phi_{-x_1v_{(1)}}\phi_{-x_1v_{(2)}-\cdots-x_1v_{(2t+1)}}$. Similarly, by easy computations after $2t$-steps we get that $\phi_{-x_1\bar{x}_2} = \phi_{-x_1v_{(1)}}\phi_{-x_1v_{(2)}}\cdots\phi_{-x_1v_{(2t+1)}}$.

We know that $-x_1v_{(l)}$ is a monomial for $l = 1, \ldots, 2t+1$, and $\phi_{-x_1v_l}$ is an automorphism. Therefore, $\phi_{-x_1\bar{x}_2}$ is an automorphism as being a composition of automorphisms.

Assume that the statement hold for $n = k$; i.e., $\phi_{(-1)^{k-1}x_1\bar{x}_2\cdots\bar{x}_k}$ be an automorphism and $\phi_{(-1)^{k-1}x_1\bar{x}_2\cdots\bar{x}_k} = \phi_{(-1)^{k-1}x_1v_{(1)}\bar{x}_3\cdots\bar{x}_k}\cdots\phi_{(-1)^{k-1}x_1v_{(2t+1)}\bar{x}_3\cdots\bar{x}_k}$ by substituting $x_2 = v$. Now let us check the statement of lemma for $n = k+1$. Let use the notation $\xi(i,k) = (-1)^k x_1v_{(i)}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}$, where $i = 1, \ldots, 2n+1$, $\bar{v} = v_{(1)} + \cdots + v_{(2t+1)}$.

$$\begin{aligned}\phi_{(-1)^kx_1\bar{x}_2\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}} &= \phi_{(-1)^kx_1\bar{v}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}}\\ &= \phi_{(-1)^kx_1(v_{(1)}+\cdots+v_{(2t+1)})\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}}\\ &= \phi_{(-1)^kx_1v_{(1)}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}+\cdots+(-1)^kx_1v_{(2t+1)}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}}\\ &= \phi_{\xi(1,k)+\cdots+\xi(2t+1,k)}\\ &= \phi_{\xi(1,k)+\phi_{\xi(1,k)}\phi^{-1}_{\xi(1,k)}\left(\xi(2,k)+\cdots+\xi(2t+1,k)\right)}\\ &= \phi_{\xi(1,k)}\phi_{\phi^{-1}_{\xi(1,k)}\left(\xi(2,k)+\cdots+\xi(2t+1,k)\right)}.\end{aligned}$$

Making use of Lemma 2.5 we have that

$$\phi_{(-1)^kx_1\bar{x}_2\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}} = \phi_{\xi(1,k)}\phi_{\xi(2,k)+\cdots+\xi(2t+1,k)}.$$

Similarly, after $2t$-steps we have that

$$\begin{aligned}\phi_{(-1)^kx_1\bar{x}_2\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}} &= \phi_{\xi(1,k)}\phi_{\xi(2,k)}\cdots\phi_{\xi(2t+1,k)}\\ &= \phi_{(-1)^kx_1v_{(1)}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}}\cdots\phi_{(-1)^kx_1v_{(2t+1)}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}}.\end{aligned}$$

$\phi_{(-1)^kx_1v_{(l)}\bar{x}_3\cdots\bar{x}_k\bar{x}_{k+1}}$ is an automorphism for $l = 1, \ldots, 2t+1$, because of induction hypothesis, $\phi_{(-1)^kx_1\bar{x}_2\cdots\bar{x}_k\bar{x}_{k+1}}$ is an automorphism being a composition of several automorphisms. Thus, the induction statement holds for all $n \geq 2$. □

Lemma 2.7. *Let $x_1, \ldots, x_n, y \in G^{(1)} \cap \omega^3(G)$ be monomials. Then*

$$\phi_{(x_1+\cdots+x_n)\bar{y}} = \phi_{x_1\bar{y}}\cdots\phi_{x_n\bar{y}}.$$

Proof.

$$\phi_{(x_1+\cdots+x_n)\bar{y}} = \phi_{x_1\bar{y}+\cdots+x_n\bar{y}} = \phi_{x_1\bar{y}}\phi_{\phi^{-1}_{x_1y}(x_2\bar{y}+\cdots+x_n\bar{y})}$$

By Lemma 2.5 we have $\phi_{(x_1+\cdots+x_n)\bar{y}} = \phi_{x_1\bar{y}}\phi_{x_2\bar{y}+\cdots+x_n\bar{y}}$. Similarly, after $n-1$ steps we have that $\phi_{(x_1+\cdots+x_n)\bar{y}} = \phi_{x_1\bar{y}}\cdots\phi_{x_n\bar{y}}$. □

Lemma 2.8. *Let $x, y \in G^{(1)} \cap \omega^3(G)$ and let x, y be monomials. Then $\phi_{x+y} = \phi_x\phi_y\phi_{-x\bar{y}}$.*

Proof. By Lemma 2.1 and Lemma 2.2 we obtain the followings:

$$\begin{aligned}\phi_{x+y} &= \phi_{x+\phi_x\phi_x^{-1}(y)} = \phi_x\phi_{\phi_x^{-1}(y)} = \phi_x\phi_{\phi_{-x}(y)} = \phi_x\phi_{y-x\bar{y}} = \phi_x\phi_{y+\phi_y\phi_y^{-1}(-x\bar{y})}\\ &= \phi_x\phi_y\phi_{\phi_y^{-1}(-x\bar{y})} = \phi_x\phi_y\phi_{\phi_{-y}(-x\bar{y})} = \phi_x\phi_y\phi_{-\phi_{-y}(x)\phi_{-y}(\bar{y})} = \phi_x\phi_y\phi_{-(x-y\bar{x})\bar{y}}\\ &= \phi_x\phi_y\phi_{-x\bar{y}}\end{aligned}$$

□

3. Main results

Theorem 3.2. *Let* $x_i, x_{j_1}, \ldots, x_{j_k} \in G^{(1)} \cap \omega^3(G)$ *be monomials for* $i = 1, \ldots, n$, $k = 1, \ldots, n-1$, $i \neq j_k$. *The homomorphism* $\phi_{x_1+\cdots+x_n}$ *can be expressed as a composition of automorphisms of the form* $\phi_{x_i}, \phi_{x_i \bar{x}_{j_1} \cdots \bar{x}_{j_k}}$.

Proof. We make induction on n. The statement of the theorem is clear for $n = 2$ by Lemma 2.8:

$$\phi_{x_1+x_2} = \phi_{x_1}\phi_{x_2}\phi_{-x_1\bar{x}_2}.$$

Assume that the statement hold for $n = k$. Now let us check the statement for $n = k+1$.

$$\begin{aligned}\phi_{x_1+\cdots+x_k+x_{k+1}} &= \phi_{x_1+\cdots+x_k+\phi_{(x_1+\cdots+x_k)}\phi^{-1}_{x_1+\cdots+x_k}(x_{k+1})} \\ &= \phi_{x_1+\cdots+x_k}\phi_{\phi^{-1}_{x_1+\cdots+x_k}(x_{k+1})}\end{aligned}$$

By Lemma 2.3 we get that

$$\begin{aligned}\phi_{x_1+\cdots+x_k+x_{k+1}} &= \phi_{x_1+\cdots+x_k}\phi_{x_{k+1}-X\bar{x}_{k+1}} \\ &= \phi_{x_1+\cdots+x_k}\phi_{x_{k+1}}\phi_{-\phi^{-1}_{x_{k+1}}(X\bar{x}_{k+1})} \\ &= \phi_{x_1+\cdots+x_k}\phi_{x_{k+1}}\phi_{-\phi_{-x_{k+1}}(X\bar{x}_{k+1})}\end{aligned}$$

where X is the same as in Lemma 2.3, and note that

$$\phi_{-x_{k+1}}(X\bar{x}_{k+1}) = \phi_{-x_{k+1}}(X)\bar{x}_{k+1} = (X + x_{k+1}Y)\bar{x}_{k+1} = X\bar{x}_{k+1}$$

for some $Y \in G^{(0)}$. Hence $\phi_{x_1+\cdots+x_k+x_{k+1}} = \phi_{x_1+\cdots+x_k}\phi_{x_{k+1}}\phi_{-X\bar{x}_{k+1}}$.

By Lemma 2.3 and Lemma 2.7 taking the structure of X into account, $\phi_{-X\bar{x}_{k+1}}$ is a composition of automorphism appearing in the statement of Lemma 2.6 which completes the proof. □

Corollary 3.2. *Let* $x \in G^{(1)} \cap \omega^3(G)$. *Then*

$$\phi_x : e_i \longrightarrow e_i + x$$

is an automorphism.

Example 3.1. Let $x = e_1e_2e_3 + e_1e_4e_5$.

$$\begin{aligned}\phi_{e_1e_2e_3+e_1e_4e_5} &= \phi_{e_1e_2e_3+\phi_{e_1e_2e_3}\phi^{-1}_{e_1e_2e_3}(e_1e_4e_5)} = \phi_{e_1e_2e_3}\phi_{\phi^{-1}_{e_1e_2e_3}(e_1e_4e_5)} \\ &= \phi_{e_1e_2e_3}\phi_{\phi_{-e_1e_2e_3}(e_1e_4e_5)} = \phi_{e_1e_2e_3}\phi_{e_1e_4e_5-e_1e_2e_3(\overline{e_1e_4e_5})} \\ &= \phi_{e_1e_2e_3}\phi_{e_1e_4e_5+\phi_{e_1e_4e_5}\phi^{-1}_{e_1e_4e_5}(-e_1e_2e_3(\overline{e_1e_4e_5}))} \\ &= \phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{\phi^{-1}_{e_1e_4e_5}(-e_1e_2e_3(\overline{e_1e_4e_5}))} \\ &= \phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{\phi_{-e_1e_4e_5}(-e_1e_2e_3(\overline{e_1e_4e_5}))} \\ &= \phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{\phi_{-e_1e_4e_5}(-e_1e_2e_3)\phi_{-e_1e_4e_5}(\overline{e_1e_4e_5}))} \\ &= \phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{-(e_1e_2e_3-e_1e_4e_5(\overline{e_1e_2e_3}))(\overline{e_1e_4e_5})} \\ &= \phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{-(e_1e_2e_3)\overline{e_1e_4e_5}} = \phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{-e_1e_2e_3e_4e_5}\end{aligned}$$

$$\begin{aligned}
\phi_{e_1e_2e_3+e_1e_4e_5}(e_i) &= (\phi_{e_1e_2e_3}\phi_{e_1e_4e_5}\phi_{-e_1e_2e_3e_4e_5})(e_i) = \phi_{e_1e_2e_3}(\phi_{e_1e_4e_5}(\phi_{-e_1e_2e_3e_4e_5}(e_i)))\\
&= \phi_{e_1e_2e_3}(\phi_{e_1e_4e_5}(e_i - e_1e_2e_3e_4e_5))\\
&= \phi_{e_1e_2e_3}(\phi_{e_1e_4e_5}(e_i) - \phi_{e_1e_4e_5}(e_1e_2e_3e_4e_5))\\
&= \phi_{e_1e_2e_3}(e_i + e_1e_4e_5 - (e_1e_2e_3e_4e_5 + e_1e_4e_5(\overline{e_1e_2e_3e_4e_5})))\\
&= \phi_{e_1e_2e_3}(e_i + e_1e_4e_5 - e_1e_2e_3e_4e_5)\\
&= \phi_{e_1e_2e_3}(e_i) + \phi_{e_1e_2e_3}(e_1e_4e_5) - \phi_{e_1e_2e_3}(e_1e_2e_3e_4e_5)\\
&= e_i + e_1e_2e_3 + e_1e_4e_5 + e_1e_2e_3(\overline{e_1e_4e_5}) - e_1e_2e_3e_4e_5 - e_1e_2e_3(\overline{e_1e_2e_3e_4e_5})\\
&= e_i + e_1e_2e_3 + e_1e_4e_5 + e_1e_2e_3e_4e_5 - e_1e_2e_3e_4e_5 = e_i + e_1e_2e_3 + e_1e_4e_5
\end{aligned}$$

Remark 3.1. Note that, the inverse of an automorphism of the form ϕ_x and the composition $\phi_x\phi_y$ of two automorphisms ϕ_x and ϕ_y indicated in Corollary 3.2 are of the same form by Lemma 2.1 and Theorem 3.2. Thus, we have the following result.

Corollary 3.3. *The set H of automorphisms of the form ϕ_x, $x \in G^{(1)} \cap \omega^3(G)$ forms a subgroup of* $\mathrm{Aut}(G)$*. Furthermore, the group H is generated by the infinite set*

$$\{\phi_x \mid x \in G^{(1)} \cap \omega^3(G) \text{ is monomial}\}.$$

4. Conclusions

In this paper, a special subgroup H of the group $\mathrm{Aut}(G)$ of automorphisms of the infinite dimensional Grassmann algebra G is characterized, similar to the subgroup A_v of the group of automorphisms $\mathrm{Aut}(G_m)$ as indicated in Theorem 1.1. We also give an infinite generating set for the subgroup H, suggesting a canonical way to express an arbitrary automorphism in H in terms of the generating elements.

The next step of the main result of this paper might be the determination of the automorphisms of the form $\phi : e_i \to e_i + x_i$, for each nonnecessarily equal $x_i \in G^{(1)} \cap \omega^3(G)$, $i \geq 1$. This will solve an important component of the group $\mathrm{Aut}(G)$. A special case of these automorphisms was suggested by Vesselin Drensky in the next theorem.

Theorem 4.3. *An endomorphism ϕ of the form*

$$\phi : e_i \to e_i + x_i\ ,\ \ x_i \in G_m^{(1)} \cap \omega^3(G) \subset G$$

is an automorphism of G.

Proof. Consider the *triangular* automorphism of G

$$\tau_x(e_i) = e_i\ ,\ \ i = 1, \dots, m,$$

$$\tau_x(e_i) = e_i + x_i\ ,\ \ i = m+1, m+2, \dots,$$

with inverse automorphism τ_{-x}. Then

$$\tau_{-x}\phi(e_i) = e_i + x_i\ ,\ \ i = 1, \dots, m,$$

$$\tau_{-x}\phi(e_i) = e_i\ ,\ \ i = m+1, m+2, \dots,$$

Clearly, $\tau_{-x}\phi$ sends G_m to G_m and is an automorphism of G_m if and only if its restriction on G_m is an automorphism of G_m. But this holds in virtue of the known results on automorphisms of G_m; i.e, its restriction is an element of A_v. □

Acknowledgements. The author is very thankful to the anonymous referees for constructive reports, to Vesselin Drensky for Theorem 4.3 and its proof, and to Şehmus Fındık for many useful discussions and suggestions.
